Project Title	Implement Client Script & UI Policy (Incident)
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) report

The proposal report aims to improve incident management in ServiceNow using Client Scripts and UI Policies, boosting data quality and efficiency. It tackles form inefficiencies, promising better operations, fewer reassignments, and happier users. Key features include real-time validation and state-based conditional field behavior.

Project Overview	
Objective	The primary objective is to improve the quality and speed of incident logging in ServiceNow by implementing Client Scripts and UI Policies on the Incident form, so that data is validated in real time and the form adapts to the incident state.
Scope	The project covers the Incident table in ServiceNow. It includes client-side validation (onLoad, onChange, onSubmit), conditional field behavior (mandatory, visible, read-only) driven by State, Category, Impact and Urgency, and testing on the Platform UI and Service Portal. Server-side logic and other modules are out of scope.
Problem Statement	
Description	The Incident form is static. It does not guide agents or validate input, so details such as Short description, Category and Impact are missed, resolution fields appear at the wrong time, and errors are found only after the record is saved. This causes wrong priority and routing, reassignments and SLA breaches.
Impact	Solving these issues will give consistent, complete incident data, fewer reassignments and reopened tickets, faster resolution within SLA, and a better experience for service desk agents and end users, without extra tooling cost.
Proposed Solution	
Approach	Use the platform's native client-side features: Client Scripts (using GlideForm APIs) for real-time validation and field dependencies, and UI Policies for no-code conditional behavior. Together they create a dynamic form that guides the user and blocks incomplete submissions.
Key Features	- onLoad Client Script to set defaults and show guidance on new incidents. - onChange Client Script to filter Subcategory by Category and validate Impact and Urgency. - onSubmit Client Script to stop saving when Short description or key fields are incomplete. - UI Policies to make Close code and Close notes mandatory when

	State is Resolved or Closed. - UI Policies to hide resolution fields until needed and lock fields after closure.

Resource Requirements

Resource Type	Description	Specification/Allocation
Hardware		
Computing Resources	CPU/GPU specifications, number of cores	Standard laptop or desktop, Intel i5 or equivalent, 4 cores (no GPU needed)
Memory	RAM specifications	8 GB
Storage	Disk space for data, models, and logs	256 GB SSD (instance is cloud-hosted)
Software		
Frameworks	ServiceNow platform and modules	Now Platform (Personal Developer Instance), Incident module
Libraries	Client-side APIs	GlideForm (g_form), GlideUser (g_user), GlideAjax, JavaScript
Development Environment	IDE	Script editor, Client Scripts and UI Policies forms; Chrome or Edge browser
Data		
Data	Source, size, format	Incident table records (sample test data, about 25 incidents, created manually or imported as XML/CSV)
